

The RainCity Partnerships Program (RCP) is a community-based public private partnership with Seattle Public Utilities (SPU) at the City of Seattle. The program builds upon over two decades of work by SPU to prevent water pollution with nature-based approaches that deliver multiple benefits. SPU brought CIS in to engage with private landowners to apply nature-based approaches to flooding.

Do you own private land in Seattle? Are you interested in capturing rain on your land to reduce flooding, beautify your neighborhood, and increase your property value?

We want to work with you to design and build a project that adds value to your property while managing rain in a sustainable way at no cost to you.

How will you benefit?

Higher Property Values: Properties with more plants and trees have a high property value due to the beauty aesthetic value that nature brings.

Lower Utility Costs: Shade from plants will lower utility cost to heat and cool the building.

Less Flooding: The rain will be absorbed into the soil and plants leading to less flooding on your property.

Healthier Communities: Rain Gardens, Bioswales, and Green Roofs clean the air and water which leads to better health for yourself and nearby residents.

Contact Us

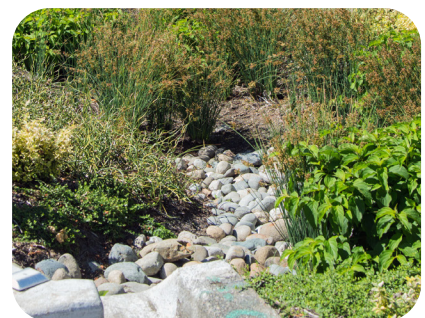

contactus@RainCity.partners

Cistern: temporarily store stormwater from your roof in above ground tanks.

Rain Garden: temporarily stores and filters stormwater.

Bioretention: landscaped basins that capture and clean stormwater.

Green Roof: a vegetated roof system that captures and stores rainwater.
